

THE ATLAS OF  
CLIMATE CHANGE

MAPPING THE WORLD'S GREATEST CHALLENGE

Kirstin Dow and Thomas E Downing

**EARTHSCAN**

# Contents

<b>Foreword by Bo Kjellén</b>	8
Introduction	9
Definition of Key Terms	14

## **PART 1: SIGNS OF CHANGE** 19

<b>Warning Signs</b>	
<i>New records and observations around the world are consistent with scientists' expectations of climate change.</i>	20
<b>Polar Changes</b>	
<i>Warming in the polar regions is driving large-scale melting of ice that will have both local and global consequences.</i>	22
<b>Glacial Retreat</b>	
<i>Most of the world's glaciers are retreating at unprecedented rates – a clear sign of warming.</i>	24
<b>Everyday Extremes</b>	
<i>Weather-related disasters are becoming increasingly common around the world.</i>	26

## **PART 2: FORCING CHANGE** 29

<b>The Greenhouse Effect</b>	
<i>The increasing concentration of greenhouse gases is trapping more heat.</i>	30
<b>The Climate System</b>	
<i>The entire climate system is adjusting to an increase in the heat trapped in the Earth's atmosphere.</i>	32
<b>Interpreting Past Climates</b>	
<i>Concentrations of carbon dioxide and methane are higher than they have ever been in the last 650,000 years. The Earth is warmer than in the past 1,000 years.</i>	34
<b>Forecasting Future Climates</b>	
<i>Global temperatures are predicted to continue rising.</i>	36

## **PART 3: DRIVING CLIMATE CHANGE** 39

<b>Emissions Past and Present</b>	
<i>Most greenhouse gases have been, and are, emitted to meet the needs of modern industrial societies.</i>	40
<b>Fossil Fuels</b>	
<i>The emission of greenhouse gases from the burning of fossil fuels is the major cause of climate change.</i>	42
<b>Methane and Other Gases</b>	
<i>A range of greenhouse gases contribute to climate change.</i>	44
<b>Transportation</b>	
<i>International trade, travel and a growing dependence on motor vehicles make transportation one of the main sources of greenhouse gas emissions.</i>	46

### **Disrupting the Carbon Balance**

*Carbon is essential in the natural environment, but changes in land use may release stored carbon and contribute to climate change.*

48

### **Agriculture**

*Greenhouse gases are emitted in the production of food. While some agriculture meets basic needs, some simply provides wealthy consumers with the luxury of choice.*

50

## **PART 4: EXPECTED CONSEQUENCES**

53

### **Disrupted Ecosystems**

*Many species and ecosystems, already at risk from human development, may not be able to adapt to new climatic conditions and stresses.*

54

### **Threatened Water Supplies**

*Water scarcity is already a growing concern. In some places climate change will make it even more critical.*

56

### **Food Security**

*Climate change threatens food security, although crop yields in temperate regions may improve.*

58

### **Threats to Health**

*Climate change threatens human health. The poorest regions are likely to be the hardest hit.*

60

### **Rising Sea Levels**

*Thermal expansion of oceans and melting ice will lead to a substantial rise in sea level, threatening many coastal communities.*

62

### **Cities at Risk**

*Coastal erosion, salt-water intrusion into freshwater supplies, and coastal storms all threaten coastal areas – often regions of high population growth and intensive economic development.*

64

### **Cultural Losses**

*Damage to indigenous cultures, historical monuments and archaeological sites adds to the incalculable economic losses of climate change.*

66

## **PART 5: RESPONDING TO CHANGE**

69

### **International Action**

*Most countries have acknowledged the problem of climate change by signing the Convention on Climate Change.*

70

### **Meeting Kyoto Targets**

*Many countries are making progress towards their Kyoto commitments, but even the agreed targets fall far short of stabilizing greenhouse gas emissions at levels considered to be safe.*

72

### **Carbon Trading**

*Trading in carbon credits is one way to share the burden of reducing emissions globally.*

74

<b>Financing Responses</b>	
<i>Current funding is inadequate to help countries respond to climate change.</i>	76
<b>Local Commitment</b>	
<i>In many places, local and regional authorities are developing more aggressive emission reduction policies than federal governments.</i>	78
<b>Carbon Dioxide and Economic Growth</b>	
<i>Economic growth can be achieved with lower greenhouse gas emissions.</i>	80
<b>Renewable Energy</b>	
<i>Renewable energy sources could be the technological key to economically and socially sustainable societies.</i>	82
<b>Adapting to Change</b>	
<i>The capacity to adapt to climatic hazards and stresses depends on a country's wealth, resources and governance.</i>	84

<b>PART 6: COMMITTING TO SOLUTIONS</b>	<b>87</b>
--	-----------

<b>Personal Action</b>	
<i>People all over the world are taking measures to reduce the greenhouse gases emitted as a result of the way they live.</i>	88
<b>Public Action</b>	
<i>The policies, practices, and investments of governments, businesses, and civic organizations will have the greatest impact on our future.</i>	90

<b>PART 7: CLIMATE CHANGE DATA</b>	<b>93</b>
