

THE ATLAS OF
GLOBAL
INEQUALITIES

Introduction	9
1 Economic Inequalities	14
Income	16
<i>Income inequality both between and within countries has risen dramatically during the process of industrialization.</i>	
Household Wealth	18
<i>Household wealth is unevenly distributed across the world. A huge proportion is concentrated in the hands of a very few.</i>	
Consumption	20
<i>Poor households have to spend most of their income on food, with little left for other purposes.</i>	
Work & Unemployment	22
<i>Differences in livelihoods, remuneration, unemployment, and underemployment create considerable inequalities.</i>	
Labor Migration	24
<i>Labor migration can help address global inequalities.</i>	
2 Power Inequalities	26
International Trade	28
<i>Globally determined commodity prices and high tariffs on imports from poorer nations create barriers to trade equality.</i>	
Budget Priorities	30
<i>The proportion of GDP that governments spend on the military, healthcare, education, and social security provides one measure of their social priorities.</i>	
Government Action	32
<i>In response to popular pressure, governments may attempt to reduce inequality through minimum wage laws, progressive taxation, and land reforms.</i>	
Freedom & Democracy	34
<i>While freedoms and democracy are hard to quantify, even rough measures indicate significant inequalities within and between nations.</i>	
Incarceration & Execution	36
<i>Rates of imprisonment vary widely around the world, and the use of execution is rare in industrialized countries.</i>	
3 Social Inequalities	38
Gender	40
<i>Bias against women is reflected in their unequal political and economic participation and influence, their hours in unpaid work, and in the preference for sons over daughters.</i>	
Age	42
<i>Age distinctions can create inequalities by excluding age groups and undervaluing their work. Population structures provide impetus for looking beyond national boundaries.</i>	

Class	44
<i>Class divisions separate the rich and powerful from those who have little opportunity to gain wealth and influence.</i>	
Race & Ethnicity	46
<i>Some minority ethnic and religious groups suffer systematic discrimination. Inequalities associated with ethnicity are frequently intertwined with those of gender and poverty.</i>	
Child Labor	48
<i>Millions of children are employed in paid or household work. Raising wages and reducing poverty is the most effective way of reducing child labor.</i>	

4 Inequalities of Access 50

Poverty	52
<i>Poverty remains widespread, but recent studies suggest new avenues for action.</i>	
Hunger	54
<i>Hunger, is one of the most devastating dimensions of inequality. Children are particularly at risk from its effects.</i>	
Household Water	56
<i>Poor people and those living in rural areas are least likely to have easy access to safe drinking water.</i>	
Energy	58
<i>Energy is a prerequisite for economic opportunities and human development that remains inaccessible to many due to poverty, rural location, or lack of infrastructure.</i>	
Household Fuel	60
<i>Most people in developing countries have access only to biomass and solid fuels for household use. These fuels pose serious health hazards.</i>	
Mobility	62
<i>The opportunity to travel easily and safely even for short distances is a key indicator of both economic and gender inequality.</i>	
Digital Divide	64
<i>The digital divide between industrialized and non-industrialized countries constrains the advance of healthcare, education, social freedoms, and livelihoods.</i>	

5 Health Inequalities 66

Life Expectancy	68
<i>Societies with higher GDP tend to have higher life expectancy. Societies with greater equality achieve longer life spans than more unequal societies.</i>	
Maternal Mortality	70
<i>The half a million women who die each year from complications related to pregnancy are mainly from the poorest people in the least developed countries.</i>	
Child Mortality	72
<i>Children in developing countries become sick and often die of preventable or treatable diseases.</i>	
Access to Healthcare	74
<i>Access to healthcare is worst in low-income countries, in rural areas and for the poor. The rich benefit most from government health expenditure.</i>	
Infectious Diseases	76
<i>Malaria, HIV/AIDS, and tuberculosis have a devastating effect on the poorest and most vulnerable people in developing countries.</i>	

6 Educational Inequalities	78
Literacy	80
<i>Poverty, poor quality education, and lack of educational opportunity for girls all influence national literacy levels.</i>	
Barriers to Education	82
<i>Poverty, gender, disability, language, location, and ethnicity constitute major barriers to education.</i>	
Early Childhood Care & Education	84
<i>Children who are denied access to early childhood care and pre-school education suffer a range of health and educational disadvantages.</i>	
7 Environmental Inequalities	86
Climate Change	88
<i>Industrialized countries have historically been the largest carbon emitters, but developing nations and the poor bear the brunt of the resultant climate disasters.</i>	
Deforestation	90
<i>Rapid deforestation is having a negative environmental impact and threatening the livelihoods of a quarter of the world's population.</i>	
Air Pollution & Health	92
<i>Air pollution, both indoors and outdoors, is a significant cause of death and disabling disease.</i>	
Water & Health	94
<i>A tenth of all disease could be alleviated by improvements in household water, sanitation, and water-resource management. The poor are most likely to lack clean water and sanitation services.</i>
