

Fred Bunz

Principles of Cancer Genetics

Second Edition

 Springer

Contents

1 The Genetic Basis of Cancer	1
The Cancer Gene Theory	1
Cancers Are Invasive Tumors	2
Cancer Is a Unique Type of Genetic Disease.....	3
What Are Cancer Genes and How Are They Acquired?	4
Mutations Alter the Human Genome	5
Genes and Mutations.....	7
Single Nucleotide Substitutions.....	13
Gene Silencing Is Marked by Cytosine Methylation: Epigenetics	16
Environmental Mutagens, Mutations and Cancer	17
Inflammation Promotes the Propagation of Cancer Genes	22
Stem Cells, Darwinian Selection and the Clonal Evolution of Cancers.....	25
Selective Pressure and Adaptation: Hypoxia and Altered Metabolism.....	28
Multiple Somatic Mutations Punctuate Clonal Evolution	30
Tumor Growth Leads to Cellular Heterogeneity.....	31
Tumors Are Distinguished by Their Spectrum of Driver Gene Mutations and Passenger Gene Mutations.....	33
Colorectal Cancer: A Model for Understanding the Process of Tumorigenesis.....	33
Do Cancer Cells Divide More Rapidly Than Normal Cells?.....	37
Germline Cancer Genes Allow Neoplasia to Bypass Steps in Clonal Evolution	38
Cancer Syndromes Reveal Rate-Limiting Steps in Tumorigenesis.....	40
The Etiologic Triad: Heredity, the Environment, and Stem Cell Division	43
Understanding Cancer Genetics.....	45
Further Reading	46

2	Oncogenes	47
	What Is An Oncogene?	47
	The Discovery of Transmissible Cancer Genes	47
	Viral Oncogenes Are Derived from the Host Genome	50
	The Search for Activated Oncogenes: The RAS Gene Family	52
	Complex Genomic Rearrangements: The MYC Gene Family	55
	Proto-oncogene Activation by Gene Amplification	56
	Proto-oncogenes Can Be Activated by Chromosomal Translocation	60
	Chromosomal Translocations in Liquid Tumors	60
	Chronic Myeloid Leukemia and the Philadelphia Chromosome	61
	Oncogenic Activation of Transcription Factors in Prostate Cancer and Ewing's Sarcoma	65
	Oncogene Discovery in the Genomic Era: Mutations in <i>PIK3CA</i>	67
	Selection of Tumor-Associated Mutations	69
	Multiple Modes of Proto-oncogene Activation	70
	Oncogenes Are Dominant Cancer Genes	71
	Germline Mutations in <i>RET</i> and <i>MET</i> Confer Cancer Predisposition	72
	Proto-oncogene Activation and Tumorigenesis	73
	Further Reading	74
3	Tumor Suppressor Genes	75
	What Is a Tumor Suppressor Gene?	75
	The Discovery of Recessive Cancer Phenotypes	76
	Retinoblastoma and Knudson's Two-Hit Hypothesis	77
	Chromosomal Localization of the Retinoblastoma Gene	80
	The Mapping and Cloning of the Retinoblastoma Gene	82
	Tumor Suppressor Gene Inactivation: The Second 'Hit' and Loss of Heterozygosity	85
	Recessive Genes, Dominant Traits	87
	<i>APC</i> Inactivation in Inherited and Sporadic Colorectal Cancers	88
	<i>TP53</i> Inactivation: A Frequent Event in Tumorigenesis	91
	Functional Inactivation of p53: Tumor Suppressor Genes and Oncogenes Interact	93
	Mutant <i>TP53</i> in the Germline: Li-Fraumeni Syndrome	94
	Gains-of-Function Caused by Cancer-Associated Mutations in <i>TP53</i>	98
	Cancer Predisposition: Allelic Penetrance, Relative Risk and the Odds Ratio	99
	Breast Cancer Susceptibility: <i>BRCA1</i> and <i>BRCA2</i>	104
	Genetic Losses on Chromosome 9: <i>CDKN2A</i>	108
	Complexity at <i>CDKN2A</i> : Neighboring and Overlapping Genes	111
	Genetic Losses on Chromosome 10: <i>PTEN</i>	113
	<i>SMAD4</i> and the Maintenance of Stromal Architecture	116

Two Distinct Genes Cause Neurofibromatosis 119

From Flies to Humans, Patched Proteins Regulate
Developmental Morphogenesis..... 121

von Hippel-Lindau Disease..... 122

NOTCH1: Tumor Suppressor Gene or Oncogene?..... 122

Multiple Endocrine Neoplasia Type 1 123

Most Tumor Suppressor Genes Are Tissue-Specific 124

Modeling Cancer Syndromes in Mice 126

Genetic Variation and Germline Cancer Genes 128

Tumor Suppressor Gene Inactivation During
Colorectal Tumorigenesis 130

Inherited Tumor Suppressor Gene Mutations:
Gatekeepers and Landscapers 132

Maintaining the Genome: Caretakers 133

Further Reading 133

4 Genetic Instability and Cancer 135

What Is Genetic Instability?..... 135

The Majority of Cancer Cells Are Aneuploid..... 136

Aneuploid Cancer Cells Exhibit Chromosome Instability..... 138

Chromosome Instability Arises Early in Colorectal Tumorigenesis..... 140

Chromosomal Instability Accelerates Clonal Evolution..... 141

Aneuploidy Can Result from Mutations
That Directly Impact Mitosis 143

STAG2 and the Cohesion of Sister Chromatids 144

Other Genetic and Epigenetic Causes of Aneuploidy..... 146

Transition from Tetraploidy to Aneuploidy
During Tumorigenesis..... 148

Multiple Forms of Genetic Instability in Cancer 149

Defects in Mismatch Repair Cause Hereditary
Nonpolyposis Colorectal Cancer 151

Mismatch Repair-Deficient Cancers Have
a Distinct Spectrum of Mutations 157

Defects in Nucleotide Excision Repair
Cause Xeroderma Pigmentosum..... 158

NER Syndromes: Clinical Heterogeneity and Pleiotropy..... 163

DNA Repair Defects and Mutagens Define
Two Steps Towards Genetic Instability..... 166

Defects in DNA Crosslink Repair Cause Fanconi Anemia 167

A Defect in DNA Double Strand Break
Responses Causes Ataxia-Telangiectasia..... 172

A Unique Form of Genetic Instability
Underlies Bloom Syndrome..... 175

Aging and Cancer: Insights from the Progeroid Syndromes 179

Instability at the End: Telomeres and Telomerase 182

Overview: Genes and Genetic Stability	184
Further Reading	185
5 Cancer Genomes	187
Discovering the Genetic Basis of Cancer: From Genes to Genomes	187
What Types of Genetic Alterations Are Found in Tumor Cells?.....	188
How Many Genes Are Mutated in the Various Types of Cancer?	188
What Is the Significance of the Mutations That Are Found in Cancers?	191
When Do Cancer-Associated Mutations Occur?	193
How Many Different Cancer Genes Are There?.....	194
How Many Cancer Genes Are Required for the Development of Cancer?	195
Cancer Genetics Shapes Our Understanding of Metastasis	195
Tumors Are Genetically Heterogenous.....	197
Beyond the Exome: The ‘Dark Matter’ of the Cancer Genome	199
A Summary: The Genome of a Cancer Cell	200
Further Reading	200
6 Cancer Gene Pathways.....	203
What Are Cancer Gene Pathways?.....	203
Cellular Pathways Are Defined by Protein-Protein Interactions	205
Individual Biochemical Reactions, Multistep Pathways, and Networks	207
Protein Phosphorylation Is a Common Regulatory Mechanism.....	210
Signals from the Cell Surface: Protein Tyrosine Kinases	212
Membrane-Associated GTPases: The RAS Pathway	217
An Intracellular Kinase Cascade: The MAPK Pathway	219
Genetic Alterations of the RAS Pathway in Cancer	219
Membrane-Associated Lipid Phosphorylation: The PI3K/AKT Pathway.....	221
Control of Cell Growth and Energetics: The mTOR Pathway.....	224
Genetic Alterations in the PI3K/AKT and mTOR Pathways Define Roles in Cell Survival.....	225
The STAT Pathway Transmits Cytokine Signals to the Cell Nucleus	227
Morphogenesis and Cancer: The WNT/APC Pathway.....	229
Dysregulation of the WNT/APC Pathway in Cancers	231
Notch Signaling Mediates Cell-to-Cell Communication	233
Morphogenesis and Cancer: The Hedgehog Pathway	234
TGF- β / SMAD Signaling Maintains Adult Tissue Homeostasis.....	236
MYC Is a Downstream Effector of Multiple Cancer Gene Pathways.....	239
p53 Activation Is Triggered by Damaged or Incompletely Replicated Chromosomes	242

p53 Is Controlled by Protein Kinases Encoded
by Tumor Suppressor Genes 244

p53 Induces the Transcription of Genes
That Suppress Cancer Phenotypes 247

Feedback Loops Dynamically Control p53 Abundance 250

The DNA Damage Signaling Network Activates
Interconnected Repair Pathways 252

Inactivation of the Pathways to Apoptosis in Cancer 254

RB1 and the Regulation of the Cell Cycle 257

Several Cancer Gene Pathways Converge on Cell Cycle Regulators 261

Many Cancer Cells Are Cell Cycle Checkpoint-Deficient 263

Chromatin Modification Is Recurrently
Altered in Many Types of Cancer 264

Summary: Putting Together the Puzzle 266

Further Reading 268

7 Genetic Alterations in Common Cancers 271

Cancer Genes Cause Diverse Diseases 271

Cancer Incidence and Prevalence 272

Lung Cancer 274

Prostate Cancer 276

Breast Cancer 278

Colorectal Cancer 280

Endometrial Cancer 282

Melanoma of the Skin 283

Bladder Cancer 285

Lymphoma 286

Cancers in the Kidney 288

Thyroid Cancer 289

Leukemia 290

Cancer in the Pancreas 292

Ovarian Cancer 294

Cancers of the Oral Cavity and Pharynx 295

Liver Cancer 297

Cancer of the Uterine Cervix 298

Stomach Cancer 299

Brain Tumors 300

Further Reading 302

8 Cancer Genetics in the Clinic 305

The Uses of Genetic Information 305

Elements of Cancer Risk: Carcinogens and Genes 306

Identifying Carriers of Germline Cancer Genes 307

Cancer Genes as Biomarkers of Early Stage Malignancies 310

Cancer Genes as Biomarkers for Diagnosis,
Prognosis and Recurrence 313

Conventional Anticancer Therapies Inhibit Cell Growth	316
Exploiting the Loss of DNA Repair Pathways: Synthetic Lethality	317
On the Horizon: Achieving Synthetic Lethality in <i>TP53</i> -Mutant Cancers	319
Molecularly Targeted Therapy: <i>BCR-ABL</i> and Imatinib	320
Clonal Evolution of Therapeutic Resistance.....	324
Targeting <i>EGFR</i> Mutations	325
Antibody-Mediated Inhibition of Receptor Tyrosine Kinases	327
Inhibiting Hedgehog Signaling	328
A Pipeline from Genetically-Defined Targets to Targeted Therapies	330
Neoantigens Are Recognized by the Immune System.....	332
The Future of Oncology	334
Futher Reading.....	335
Index	337
