

*Infra Eco Logi Urbanism* posits an approach and a vision for architecture at the urban scale within the contemporary post-metropolitan condition. The volume assembles a multi-year research and speculative design project by the architectural practice RVTR that examines extant and emerging urban systems within North America's Great Lakes Megaregion and develops design propositions to leverage regional infrastructures toward resilient urban and public ends. The project explores how design might claim a more active role in imagining and transforming the future of urbanism, settlement patterns, and metropolitan life by working through ecological and systems-based approaches within the de-centered, infrastructure and logistics dominated hybrid urban territories that define contemporary megaregions.
