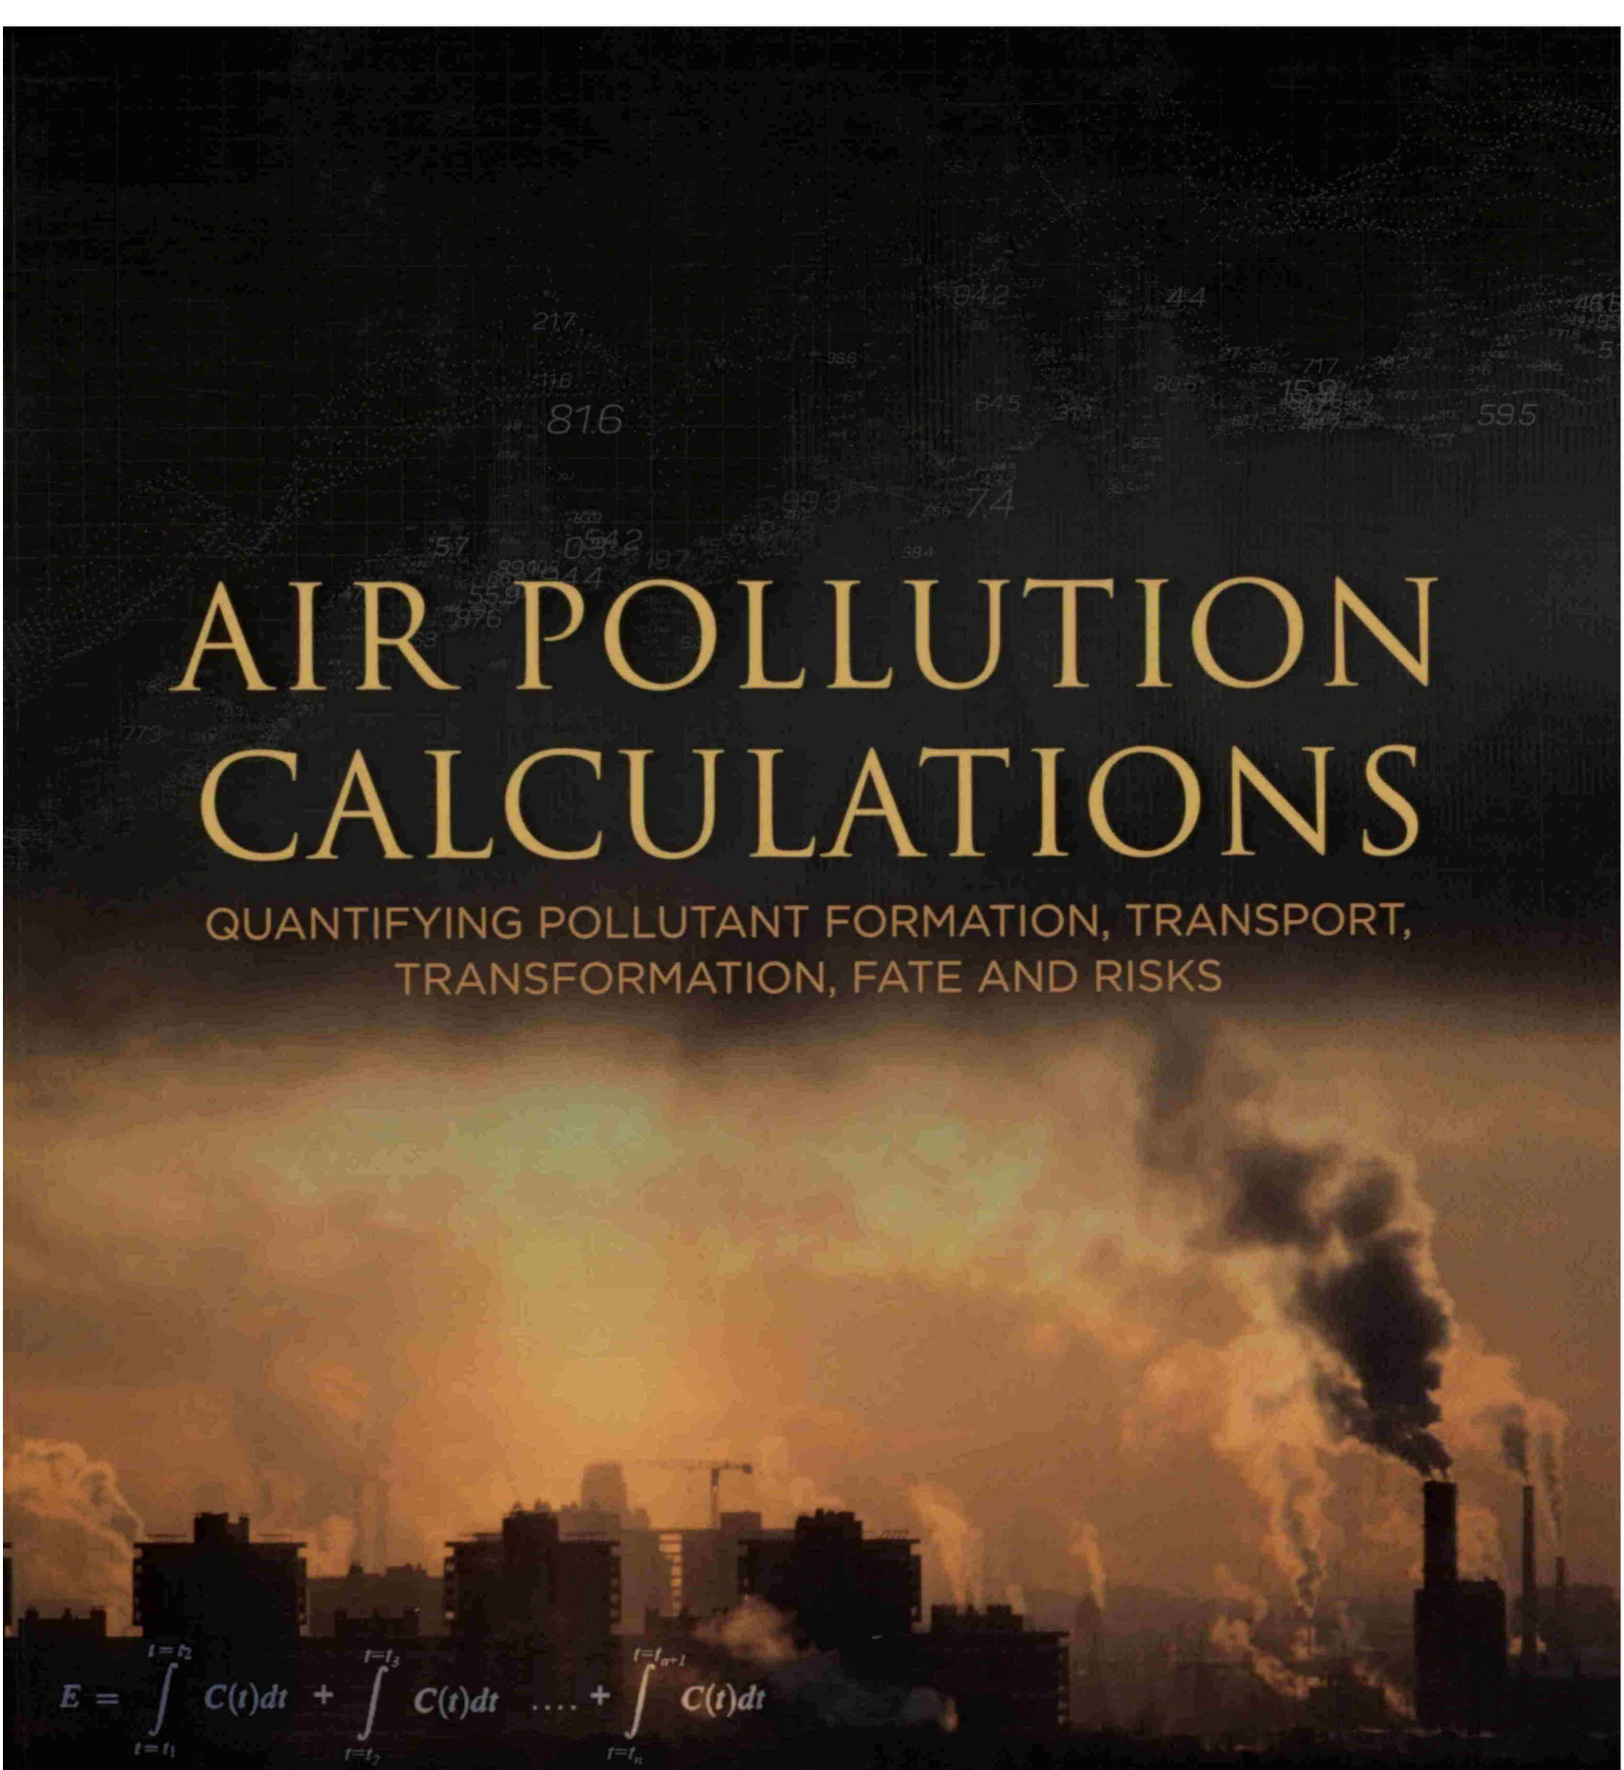
AIR POLLUTION CALCULATIONS

QUANTIFYING POLLUTANT FORMATION, TRANSPORT, TRANSFORMATION, FATE AND RISKS



DANIEL A. VALLERO

ELSEVIER

Contents

Preface xi

1. Introduction

1.1 What is air pollution? 1
1.2 A bit of history 2
1.2.1 Black smoke 5
1.2.2 Recent history 6
1.3 The science of air pollution 7
1.4 The atmosphere 7
1.4.1 Tropospheric physics 8
1.4.2 Atmospheric pressure 12
1.4.3 Standard conditions 12
1.5 Recent trends 13
1.6 Spatial scale 13
1.6.1 Local scale 14
1.6.2 Urban scale 14
1.6.3 Regional scale 15
1.6.4 Continental scale 16
1.6.5 Global scale 16
1.7 Stressor-receptor paradigm 16
1.8 Calculation basics 18
1.8.1 Mathematics and statistics 19
1.9 Systems thinking and sustainability 24
1.10 Conclusions 25
References 25
Further reading 27

2. Characterizing air pollutants

2.1 The periodic table 29
2.1.1 Isotopes 29
2.2 Empirical calculations 30
2.3 Health characterization 31
2.4 Formation reactions 33
2.4.1 Formation kinetics 34
2.5 Reaction types 36
2.6 Pollutant formation processes: Introduction to chemodynamics 37
2.7 Nonchemical concentrations 43
References 44
Further reading 44

3. Pollutant transformation

3.1 Introduction 45
3.2 The compound 46
3.3 Air pollution kinetics 46
3.3.1 Rate order and half-life 47
3.3.2 Atmospheric kinetics 50
3.4 Energy in atmospheric transformations 53
3.4.1 Atmospheric photochemistry 55
3.4.2 Energy and bonds 56
3.4.3 Photoabsorption 57
3.5 Atmospheric kinetics calculations 58
3.5.1 Free radicals 64
3.6 Transformation thermodynamics 65
3.6.1 Entropy and enthalpy 65
References 71
Further reading 71

4. Environmental partitioning

4.1 Introduction 73
4.1.1 Vapor pressure 73
4.1.2 Solubility 74
4.2 Equilibrium 76
4.2.1 Solubility constant 76
4.2.2 The partition coefficient 77
4.2.3 Fugacity 78
4.3 Partitioning and transport 80
4.3.1 Volatilization 80
4.3.2 Compartmental affinity and fugacity 81
4.4 Integrating inherent properties and substrate characteristics 84
4.5 Movement from liquid to solid phase 88
4.6 The octanol-water coefficient 91
4.6.1 Co-solvation 94
4.7 Partitioning between air and tissue 95
4.7.1 Calculating the octanol-air partition coefficient 95
4.7.2 Dynamics within an organism 96
4.7.3 Microbial partitioning 102
4.8 Conclusions 104
References 104
Further reading 104

5. Air partitioning

5.1 Introduction 107
5.2 Henry's law revisited 107
5.3 Movement into the atmosphere 111
5.3.1 Net exchange 116
5.3.2 Henry's law complications 118
5.4 Interfaces 119
5.5 Partitioning between air and tissue 120
5.5.1 Calculating the octanol-air partition coefficient 121
References 122
Further reading 122

6. Physical transport of air pollutants

6.1 Introduction 123
6.2 Partitioning meets the laws of motion 123
6.2.1 Concentration and flux 124
6.2.2 Molecular diffusive flux 125
6.2.3 Eddy dispersion 128
6.2.4 Advection 129
6.2.5 Dispersion 131
6.2.6 Merging mass transfer and flow 132
6.3 Diffusion and biological processes 135
6.4 Partitioning, transport and kinetics 138
6.4.1 Transfer coefficients and fugacity 139
References 143
Further reading 143

7. Water and the atmosphere

7.1 Introduction 145
7.2 The water molecule as an agent of change 145
7.2.1 Evaporation and transpiration in the hydrosphere 145
7.3 The hydrosphere 151
7.4 Ionization, acidity and alkalinity 151
7.5 Pollutant deposition from the hydrosphere 159
7.6 Intercompartmental exchange to and from the hydrosphere 161
7.7 Water, oxygen and energy relationships 165
7.8 Reactions with water 170
References 173
Further reading 174

8. Air pollution biogeochemistry

8.1 Introduction 175
8.2 Spheres and cycles 175
8.3 Carbon equilibrium and cycling 176
8.3.1 The carbon cycle and greenhouse effect 179
8.3.2 Global warming potential 180
8.3.3 Combustion and carbon 181
8.4 Nutrient cycling 181
8.4.1 The nitrogen cycle 182
8.4.2 The sulfur cycle 187
8.4.3 Interactions between sulfur and nitrogen 188
8.4.4 Acid deposition 190
8.5 Metal and metalloid cycles 191
8.5.1 Metals and heat 195
8.5.2 Mercury biogeochemistry 197
8.5.3 Biogeochemistry of other heavy metals 198
8.5.4 Metalloid cycling 201
8.6 Biogeochemical cycles and decision making 203
References 203
Further reading 206

9. Thermal reactions

9.1 Introduction 207
9.2 Air and combustion 207
9.3 Volatility of combustion products 209
9.4 Flue gas 209
9.5 Thermal pollutant destruction 211
9.6 Activation energy 212
9.7 Nitrogen and sulfur 214
9.8 Metals in thermal reactions 218
References 218

10. Air pollution phases and flows

10.1 Introduction 219
10.2 Gas-phase pollutants 220
10.2.1 The gas laws 221
10.2.2 Gas characteristics 223
10.2.3 Standard conditions 225
10.2.4 Gases versus vapors 227
10.2.5 Gas density 229
10.2.6 Using the gas laws to calculate pollutant classes 229
10.3 Fluid dynamics 230
10.3.1 Dimensions of flow and mass continuity 231
10.3.2 Energy and the Bernoulli principle 237
10.3.3 Measurement 239
10.4 Aerosols 240
10.4.1 Particulate matter size and mass 244
10.4.2 Particulate matter and respiratory fluid mechanics 246
10.5 Concentration 252
10.5.1 Volume and mass conversions 253
10.5.2 Concentration gradients 254
References 260
Further reading 261

11. Sampling and analysis

11.1 Introduction 263
11.1.1 Direct and indirect sampling 263
11.2 Quality assurance 273
11.2.1 Measurement precision 274
11.2.2 Measurement accuracy 277
11.3 Data quality objectives 278
11.4 Sampling air pollutant emissions and releases 284
11.5 Ambient air pollution monitoring 285
11.5.1 Selection of a monitoring site 286
11.5.2 Air sampling approaches 289
11.5.3 Sampling approaches 291
11.6 Ambient air pollutant sampling 292
11.6.1 Passive sampling 293
11.6.2 Active sampling 295
11.6.3 Remote sensing 295
11.7 Gas and vapor phase measurement methods 295
11.7.1 Extractive sampling 296
11.7.2 Continuous emission sampling and analysis 300
11.7.3 Open-path technologies for gas-phase air pollutants 301
11.7.4 Mobile measurement technologies 307
11.8 Methods for specific pollutants 308
11.8.1 Carbon monoxide sampling 309
11.8.2 Ozone sampling 311
11.8.3 Nitrogen dioxide sampling 312
11.8.4 Sulfur dioxide sampling 313
11.8.5 Nonmethane volatile organic compounds 314
11.9 Particulate matter 315
11.9.1 Sampling particulates 317
11.9.2 PM sampler design considerations 319
11.9.3 Indirect PM measurements 320
11.10 Measuring gas and particulate phases together 321
11.10.1 Denuders 322
11.10.2 Analysis and measurement of acidic deposition 322
11.10.3 Measuring hazardous air pollutants 322
11.11 Laboratory analysis 324
11.11.1 Extraction 324
11.11.2 Sample analysis 325
References 329
Further reading 332

12. Air pollution risk calculations

12.1 Introduction 335
12.1.1 Risk, reliability and resilience 335
12.1.2 Risk and precaution 336
12.1.3 Emerging focus on near-field exposures 337
12.2 Accountability based on risk reduction and sustainability 339
12.2.1 Hazard 341
12.2.2 Exposure 342
12.2.3 Air pollution risk characterization 342
12.3 Defining risk 345
12.3.1 Modeling to support accountability 347
12.4 Dose-response curves 351
12.5 Uncertainty and factors of safety 354
12.6 Exposure estimation 357
12.7 Direct cancer risk calculations 363
12.8 Risk-based treatment targets 369
12.9 Causality 372
References 373
Further reading 375

13. Air pollution control technologies

13.1 Introduction 377
13.2 Particulate matter controls 377
13.3 Forces 379
13.3.1 Gravity 380
13.3.2 Buoyancy 381
13.3.3 Drag 381
13.4 Particle morphology 386
13.5 Mechanisms of particulate removal 386
13.6 Aerosol removal technologies 388
13.6.1 Precleaners 388
13.6.2 Inertial collectors 391
13.6.3 Inertial impaction 394
13.6.4 Brownian motion 395
13.6.5 Electrostatic mechanisms 395
13.6.6 Thermophoresis and diffusiophoresis 396
13.6.7 Net effects of forces 396
13.6.8 Filtration 397
13.6.9 Electrostatic precipitation 406
13.6.10 Wet collection 409
13.6.11 Mist elimination 412
13.7 Removal of liquid droplets and mists 413
13.7.1 Filtering liquids 413
13.7.2 Electrostatic precipitators for mists and droplets 414
13.7.3 Inertial collection of mists and droplets 414
13.7.4 Scrubbers for mists and droplets 414
13.7.5 Other systems 416
13.7.6 Comparison of particulate removal systems 416

13.8 Gas-phase pollutant controls 416
13.8.1 Absorption 416
13.8.2 Adsorption devices 418
13.8.3 Condensers 418
13.9 Air pollutant treatment technologies 418
13.9.1 Thermal treatment 421
13.9.2 Biological control systems 422
13.9.3 Comparison of gas-phase removal systems 423
13.9.4 Mercury removal 425
13.10 Removal of odors 427
13.10.1 Odor reduction by dilution 427
13.10.2 Odor removal 427
13.10.3 Odor conversion 427
References 428
Further reading 428

14. Air pollution dispersion models

14.1 Introduction 429
14.1.1 Box models 429
14.1.2 Model frames 430
14.2 Meteorological data and graphics 431
14.3 Gaussian models 434
14.4 Stability 438
14.5 Eulerian models 442
14.6 Model levels 443
14.7 Model uncertainty 444
14.8 Links to exposure and dose models 446
14.9 Recent advances 447
References 448
Further reading 448

15. Economics and project management

15.1 Introduction 449
15.2 Emission strategies 449
15.2.1 Strategies to prevent degradation of air quality 449
15.2.2 Identifying emission sources 451
15.2.3 Fuel-related strategies 452
15.2.4 Air toxics strategies 452
15.2.5 Economics and efficiency 454
15.2.6 Proportional emission predictions 455
15.3 Engineering economics 455
15.3.1 Cash flow 459
15.3.2 Discounting 460
15.4 Comparing alternatives 463
15.4.1 Social costs 463
15.4.2 Types of cost estimates 463
15.4.3 Proposal review 464
15.5 Replacement cost analysis 465
15.6 Life cycle comparisons 469
References 471
Further reading 471

16. Reliability and failure

16.1 Introduction 473
16.2 Failure classification 475
16.3 Margins of safety 476
16.3.1 Miscalculations 478
16.3.2 Improper attention to natural circumstances 479
16.3.3 Critical path failure 479
16.3.4 Negligence 483
16.3.5 Inaccurate prediction of contingencies 486
16.4 Success 486
References 486
Further reading 487

17. Air pollution decision-making

17.1 Introduction 489
17.1.1 Release-related decisions 489
17.1.2 Quality-related decisions 489
17.2 Data-based decision-making 495
17.2.1 Data and information selection 498
17.2.2 The nondetect problem 500
17.2.3 Data manipulation 501
17.3 Ethics 504
17.3.1 Responsible conduct of air pollution research 505
17.3.2 Systems thinking 506
17.3.3 Uncertainty 509
17.4 Ethical analysis of decisions and actions 511
17.4.1 Life cycle methodologies 512
17.4.2 Utility and the benefit-cost analysis 514
17.5 Linking causes and outcomes 516
17.5.1 Strength of association 517
17.5.2 Consistency 517
17.5.3 Specificity 517
17.5.4 Temporality 517
17.5.5 Gradient 518
17.5.6 Scientific plausibility 518
17.5.7 Coherence 518
17.5.8 Experimentation 518
17.5.9 Analogy 519
17.6 Analysis of complex air pollution problems 519
References 523
Further reading 525
