# List of Figures

- 2.1 Major language family distributions across the Old World at AD 1500. Some small families and isolates are omitted, for instance, Hmong-Mien and Basque. The ‘Altaic’ family contains Japonic, Korean, Ainu, Mongolic, Turkic, and Tungusic (see Figure 7.6). Original drawn by Clive Hilliker as Bellwood 2005a, Figure 1.1, using data from Ruhlen 1987. 24
- 2.2 Major language families of the New World at AD 1500. Many small families and isolates are omitted, and the large areas marked as “unrecorded, unaffiliated” reflect in part the widespread native language loss since European settlement began. Original drawn by Clive Hilliker as Bellwood 2005a, Figure 1.2, using data from Ruhlen 1987. 25
- 3.1 A current family tree for hominins, from Australopithecine ancestors to *Homo sapiens*. 37
- 3.2 Oxygen isotope records reflecting global temperatures at increasing resolutions for the last 5.3 million years (left), the Pleistocene and Holocene (from 2.58 million years ago; center), and the Upper Pleistocene and Holocene (from 130,000 years ago; right). Higher temperatures are to the right, lower to the left. Interglacials are identified by uneven numbered marine isotope stages (MIS – the Holocene is 1), glacials by even numbers. This figure is from Hertler et al. 2013, and contains original data from Lisiecki and Raymo 2005. Reproduced courtesy of the authors. 42
- 3.3 Early hominin (pre-Neanderthal and pre-*sapiens*) fossil find places and archaeological sites in the Old World. Background map by Multimedia Services, ANU, details added by the author. 44

3.4	Major Paleolithic stone tool forms considered by archaeologists to be diagnostic in discussions about human evolution. (a, b) Oldowan basalt pebble core and large flake (ventral view) from Koobi Fora, Lake Turkana, Tanzania; (c) Acheulian flint bifacial hand axe from Britain; (d) a quartzite example (with opposite orientation) from West Bengal, India; (e, f) Mousterian retouched flake scraper and point, Combe Grenal cave (Dordogne), France; (g) Levalloisian ‘tortoise’ (prepared) flint core with a detached flake (modern copy – white arrows show direction of strike); (h, i) prismatic blade core and long blade of flint (Upper Paleolithic, France). All from the collections of the School of Archaeology and Anthropology at ANU, photos by the author.	47
3.5	Old World localities associated with biological and cultural remains of Neanderthals and early <i>H. sapiens</i> . Kya = thousands of years ago. Background map by Multimedia Services, ANU, details added by the author.	56
4.1	The colonization of the Americas. Extents of ice cover are only approximate, but the huge extent of the North American glaciers is evident. Background map by Multimedia Services, ANU, details added by the author.	87
5.1	Suggested early migrations of the speakers of Uralic languages, after Blažek 2013b with minor modifications, reprinted courtesy of the author. Map production by Multimedia Services, ANU.	100
5.2	The distributions of Na-Dene languages and White River volcanic ash. Reproduced with minor modifications from Matson and Magne 2013, courtesy of the authors. Original map by S. Matson.	102
5.3	The distributions of Paleoeskimo archaeological complexes (circa 2000 BC), superimposed by the linguistic migrations of Eskimo-Aleut populations, especially the major Thule Inuit migration after AD 1200. Background map by Multimedia Services, ANU, with original data added by the author from maps in Fortescue 2013; Friesen 2013.	106
5.4	Pre-pastoral human occupation in the Green Sahara during the mid-Holocene. Background map by Multimedia Services, ANU, details added by the author.	110
5.5	Backed artifacts and geometric microliths from Australia and the southwestern arm of Sulawesi. Top row: two backed blade-like tools and four microliths (geometric and crescentic in shape) of chert from Leang Burung shelter 1, South Sulawesi, excavated by Mulvaney and Soejono 1970. Bottom row: matching tools of chert and silcrete from southern Australia (including the two backed blade-like tools marked “Lake Illawarra”), from collections of the National Museum of Australia on loan to the School of Archaeology and Anthropology at ANU. Photos by the author.	114

- 5.6 Australia, showing the almost identical distributions of Pama-Nyungan languages with backed artifacts, and Non-Pama-Nyungan languages with bifacial points. The northern Cape York Peninsula and New Guinea lack both artifact categories. Also shown is a possible sea route linking Sulawesi and Australia, utilizing historical parallels for Makassan *teripang* collectors. Background map by Multimedia Services, ANU, details added by the author. 115
- 6.1 The homelands of agriculture in the Old World (unbroken lines and cross-hatching), with the regions (broken lines) of summer rainfall climate in Asia and Africa, and winter rainfall in the Middle East and around the Mediterranean. This figure shows that the expansions of the East Asian, African, and Fertile Crescent agricultural complexes were each constrained by the imperatives of their climatic homelands. Also shown are the less expansive western Pacific and South Asian complexes. Arrows refer to significant plant and animal transfers out of or between the zones in prehistoric times. For the New World, see Figure 9.4. Background map by Multimedia Services, ANU, details added by the author. 125
- 6.2 Chronological chart to show the inceptions of domesticatory agriculture in the various homeland regions (earlier pre-domestication phases are not indicated), together with likely dates of initial expansion of selected language families, hunter-gatherer as well as agriculturalist. Pertinent archaeological sites and cultures are also noted. 126
- 7.1 The Fertile Crescent: likely zones of cereal and animal domestication, and some major Pre-Pottery Neolithic sites. Modified from Bellwood 2005a: Figure 3.1, original map by Multimedia Services, ANU. 142
- 7.2 The expansion of Neolithic cultures from the Fertile Crescent into Europe. Archaeological cultures are in capitals with dates. (1) LBK origin region in western Hungary; (2) early LBK expansion; (3) later LBK expansion; CW Cardial Ware. Modified from Bellwood 2005a: Figure 4.1, original map by Multimedia Services, ANU. 146
- 7.3 The spread of food-producing economies through South Asia, focusing especially on the movements of Fertile Crescent plants and animals. Background map by Multimedia Services, ANU, details added by the author. 154
- 7.4 The distributions of the Indo-European subgroups at AD 1500, with selected central Asian archaeological cultures (in bold) that have featured in debates about Indo-Iranian origins. Original drawn by Multimedia Services, ANU, as Bellwood 2005a, Figure 10.1, using data from Ruhlen 1987. 158
- 7.5 A family tree with estimated divergence dates (in millennia BC) for the subgroups within the Indo-European language family, constructed by Bouckaert et al. 2012 using statistical methods from evolutionary biology. Redrawn by the author and published courtesy of Quentin Atkinson, University of Auckland. 159

- 7.6 Map to show the likely generalized distributions of the Altaic languages prior to the recent expansions of Russian and Sinitic languages. The boundaries are approximate and do not accurately reflect current distributions, especially for the Tungusic, Mongolic, and some Turkic languages that are spoken today only in small enclaves. Also shown is the recorded distribution of the Yeniseian languages, discussed in Chapter 5, from Kari and Potter 2010, Map B. Background map by Multimedia Services, ANU, using data from Ruhlen 1987. 164
- 7.7 Suggested early migrations of the speakers of Afroasiatic languages, after Blažek 2013a, reprinted courtesy of the author. Map production by Multimedia Services, ANU. The Levant homeland is suggested as the circled “AA” on the map. 170
- 8.1 The Neolithic in China and Southeast Asia. The stars indicate pre-Neolithic sites with combinations of shell middens, contorted or sitting burials, coarse pottery, and no evidence for food production. They include (1) Da But and Con Co Ngua in northern Vietnam; (2) Dingsishan and Dayan Cave near Nanning in Guangxi; (3) Zengpiyan in Guilin, Guangxi; and (4) a site on Liang Island in the Matsu Islands off Fujian (Taiwan). Individual Neolithic sites are not shown for China since there are so many, but major cultural groups referred to in the text are labeled in italics (not all are contemporary). Background map by Multimedia Services, ANU, details added by the author. 180
- 8.2 Language families of Mainland Southeast Asia. Drawn by Carmen Sarjeant and by Multimedia Services, ANU. Reproduced by permission of Paul Sidwell (see Sidwell 2013). 183
- 8.3 Likely homelands and migration routes for the early stages of the East and Southeast Asian language families. Background map by Multimedia Services, ANU, details added by the author. The dotted line indicates Neolithic obsidian transfer from New Britain to Borneo. 184
- 8.4 Holocene population movements through Island Southeast Asia and across Oceania, according to archaeological and comparative linguistic data. This map is also published in Bellwood 2013. Original by Multimedia Services, ANU. 192
- 8.5 The distribution of Lapita sites in Oceania. This map has also been published in Spriggs 2013, and is reproduced with the permission of Matthew Spriggs. 195
- 8.6 The Austronesian languages and their major subgroups, as classified by linguist Robert Blust (also published in Blust 2013). Map production by Multimedia Services, ANU. 198
- 9.1 The present-day vegetational and climatic regions of Africa, with crop homelands suggested by botanist Jack Harlan (modified from Bellwood 2005a, Figure 5.1). Original map by Multimedia Services, ANU, modified by the author. 212

9.2	Dates for the spread of cattle in Africa, with the approximate northern boundary of the tsetse fly zone at 3000 BC and the distribution of that zone today (modified from Bellwood 2005a, Figure 5.3). Original map by Multimedia Services, ANU, modified by the author.	214
9.3	Generalized directions of Bantu migration between 500 BC and AD 1000, with archaeological dates (on the map) for the appearance of pearl millet, from Manning et al. 2010b. Base map by Multimedia Services, ANU, modified by the author.	216
9.4	The main homelands of crop domestication in the New World. Sources are listed in Bellwood 2005a, Figure 8.1, with the addition of data from Piperno 2011a, 2011b. Base map by Multimedia Services, ANU, modified by the author.	220
9.5	Archaeological sites and major Early Agricultural complexes in the Americas, as discussed in the text. Base map by Multimedia Services, ANU, modified by the author.	222
9.6	The eight major language families of South America and their possible homelands. The distributions are approximate and relate to the period before AD 1500 (many regions are Spanish- and Portuguese-speaking today). This map was prepared by Clive Hilliker and Peter Bellwood, and has also been published in Aikhenvald 2013.	226
9.7	The major language families of Mesoamerica and the US Southwest and their likely homelands. Based on a map by J. Kathryn Josserand and Nicholas A. Hopkins on the web site of the Foundation for the Advancement of Mesoamerican Studies, Inc., at <a href="http://www.famsi.org/map/linguistic.html">www.famsi.org/map/linguistic.html</a> . This map has also been published in Hill 2013, and is reproduced here with the permission of Jane Hill. Map drawn by Multimedia Services, ANU.	231
9.8	The Eastern Woodland crop complex of the United States, together with possible homelands for the Algonquian, Iroquoian, and Siouan language families. Distributions of the Adena and Hopewell burial mound and ceremonial complexes are also shown. Modified from Bellwood 2005a, Figure 10.13. Original map by Multimedia Services, ANU, modified by the author.	236
